

## NOVEL PSEUDOERYTHROMYCIN DERIVATIVES

### CROSS REFERENCE TO RELATED APPLICATION

This application is a Divisional of U.S. Patent Application No. 10/088,965 filed on July 25, 2002. Application No. 10/088,965 is the national phase of PCT International Application No. PCT/JP00/05503 filed on August 17, 2000 under 35 U.S.C. § 371.

### BACKGROUND OF THE INVENTION

#### 1. Field of the Invention

The present invention relates to novel pseudoerythromycin derivatives or salt thereof.

#### 2. Description of Related Art

Erythromycin (hereinafter sometimes designates as EM) has been used for long time as 14-membered macrolide antibiotic for treatment of infectious disease caused by Gram-positive bacteria. During past ten and several years, erythromycin has known to improve long-term chronic inflammatory diseases such as diffuse panbronchiolitis and bronchial asthma, except for therapeutic action to bacterial infectious diseases. (Kudo, Shoji et al., Studies of clinical results on long term small administration of erythromycin for diffuse panbronchiolitis-Treatment results for 4 years, J. Japan. Thorac. Dis. Assoc., 25: 632-642, 1987).

Erythromycin is an antibiotic and has antibacterial action which is not always required for treatment of inflammatory diseases. Consequently, resistant bacteria are generated in

patients who are administered antibiotics, as a result, it causes deterioration for treatment of infectious disease in the other occasion.

As described above, Kudo, Shoji et al. demonstrated that diffuse panbronchiolitis could be improved by long term small administration of erythromycin (Kudo, Shoji et al., Studies of clinical results on long term small administration of erythromycin for diffuse panbronchiolitis-Treatment results for 4 years, J. Japan. Thorac. Dis. Assoc., 25: 632-642, 1987).

#### SUMMARY AND OBJECT OF THE INVENTION

Recently, actions other than antibiotic activity of erythromycin is noted, as a result, usefulness other than pulmonary region, for example not limited in diffuse panbronchiolitis but for chronic sinusitis and Crohn's disease are reported. The mechanism of action of erythromycin for chronic disease such as diffuse panbronchiolitis is thought to be the result of original antibacterial action. Research studies are now ongoing, and indicate the antiinflammatory action mediated by immune inflammatory cells in the penumbral chronic respiratory tract inflammation.

For example, the studies indicate the regulation for migration of neutrophils to infectious region by direct action, and the regulation for migration of neutrophils or for release of active oxygen from neutrophils by indirect action through mediators or cytokines. Further, erythromycin has an action to lymphocytes, macrophages and mast cells to regulate their proliferation or cytokine production, or to induce differentiation. (Kudo, Shoji Ed., Supervisors: Shimizu,

Kihachiro and Omura Satoshi "Inflammation, Immunity and Macrolides Up to Date", Iyaku Journal Inc., Osaka, 1996)

As explained above, 14-membered macrolides are thought to cure chronic respiratory diseases as a result of exhibiting immune regulation and antiinflammatory action.

We have aimed at the promoting action of erythromycin for differentiation-induction from monocyte to macrophage (N. Keicho, S. Kudoh, H. Yotsumoto, K. Akagawa, "Erythromycin promotes monocyte to macrophage differentiation", J. Antibiotics, 47, 80-89, 1994), and tried to synthesize erythromycin derivatives for the purpose of creating the derivatives having disappeared antibacterial action and enhanced promoting action for differentiation-induction.

The present invention relates to a novel pseudoerythromycin derivative represented by the general formula [I],

wherein  $R_1$  and  $R_2$  are same or different and each represents H, alkyl, alkynyl, acyl, or sulfonyl, in which these groups may optionally have substituents, and Me indicates methyl.

Further, the present invention relates to a novel pseudoerythromycin derivative represented by the general formula [II],

wherein R is heterocyclic containing N which may optionally have substituents, and Me indicates methyl.

The present invention further relates to a novel pseudoerythromycin derivative represented by the general formula [III],

wherein R<sub>3</sub> is O or NOH, and Me indicates methyl.

The invention further relates to a novel pseudoerythromycin derivative represented by the general formula [IV],

wherein R<sub>1</sub> and R<sub>2</sub> are same or different and each represents H or methyl, R<sub>3</sub> and R<sub>4</sub> represent H, hydroxyl or amino, and Me indicates methyl.

The present invention further relates to a novel pseudo erythromycin derivative represented by the general formula [V],

wherein R<sub>1</sub> and R<sub>2</sub> are same or different and each represents H or methyl, and Me indicates methyl.

Synthetic methods of various erythromycin derivatives are, for example, illustrated in the synthetic scheme as shown in Fig. 1. Namely, erythromycin A is treated with ice-cold acetic acid according to the references: (a) I. O. Kibwage, R. Busson, G. Janssen, J. Hoogmartens, H. Vanderhaeghe, Translactonization of Erythromycins, J. Org. Chem., 52, 990-996, 1987, (b) H. A. Kirst, J. A. Wind, J. W. Paschal, Synthesis of Ring-Constrained Derivatives of Erythromycin, J. Org. Chem., 52, 4359-4362, 1987, introducing to erythromycin A enol ether (EM 201), subsequently refluxing in methanol with heating in the presence of potassium carbonate to introduce pseudoerythromycin A enol ether (EM701) (known compound).

The product was treated with iodine and sodium acetate according to the reference (L.A. Friberg, U.S. Patent 3,725,385) to obtain de-N-methyl-pseudoerythromycin A enol ether (EM703) (known compound). The compound was further treated with iodine and sodium methoxide to obtain bis(de-N-methyl)-pseudo erythromycin A enol ether (EM721) (novel compound). Alkylation, acylation and sulfonylation using EM703 and EM721 resulted to

synthesize various derivatives through bis-de(3'-N-methyl)-3'-N-ethyl-8, 9-anhydro-pseudoerythromycin A 6, 9-hemiketal (EM722).

The synthetic scheme of compounds of the present invention is illustrated in Fig. 1. Namely, the compounds can be obtained by the synthetic route of: erythromycin A (EMA) → erythromycin A enol ether (EM201) → pseudoerythromycin A enol ether (EM701) → de-N-methyl-pseudoerythromycin A enol ether (EM703) → bis (de-N-methyl)-pseudoerythromycin A enol ether (EM721).

In order to confirm enhancing effect for differentiation-induction of the compounds of the present invention, the enhancing effect for differentiation-induction from human monocyte to macrophage was assayed. Method is performed as follows.

THP-1 cells were collected from cultured liquid by centrifugation, adjusted the concentration to  $2 \times 10^5$  cells/ml using medium (RPMI 1640) and distributed into the 48-well plate at 500  $\mu$ l/well. PMA solution 10  $\mu$ l and sample solution 5  $\mu$ l were added in each well, stirred with mild shaking and incubated at 37 °C for 72-96 hours under 5% CO<sub>2</sub>. Further MTT 0.5 mg/ml solution was added at 300  $\mu$ l/well, and incubated at 37°C for 3 hours under 5% CO<sub>2</sub>. Supernatant solution was suctioned using the injection tube, added DMSO 500  $\mu$ l using automatic continuous injector to dissolve formazan completely and transferred each 100  $\mu$ l to the 96-well plate. The optical absorption was measured using the plate-reader.

Results of the enhancing effect for differentiation-induction from human monocyte to macrophage measured by the above assay method are shown in Table 1.

In Table 1: Me: methyl; Pr : propyl; Et: ethyl; Ac: acetyl; and Ms: methanesulfonyl. \*ED<sub>50</sub>: Drug concentration (μ M) required for 50% differentiation-induction of THP in Mφ.

In Table 1, indicated activity is represented in comparison with enhancing action for differentiation-induction of EM 100 μM, and symbols are: ++: enhanced 100% or more; +: enhanced 50-100%; ±: enhanced 25-50%; -: no activity; /: expressed cytotoxicity; and NT: not tested or under assessment.

As shown in Table 1, since the smaller the value of ED<sub>50</sub> (μ M) (minimum drug concentration required for 50% differentiation-induction from THP-1 to Mφ), the stronger the differentiation-induction activity, it was found that the compounds of the present invention have enhancing action for differentiation-induction from THP-1 to Mφ.

Next, the suppressive effect of the compound of the present invention (EM703) against bleomycin-induced pulmonary fibrosis

was examined (hereinafter sometimes designates bleomycin as BLM).

A sample suspended in 5% gum arabic was orally administered, 50mg/kg/day for 17 days (from day-3 to day-13), and bleomycin, 100mg/kg, was administered from tail vein in day-0. On day-28, animals were sacrificed under anesthesia and fibrosis of the lungs was compared with non-administered mice. Suppressive effects are shown in Table 2.

As indicated above, hydroxyproline is an index of lung fibrosis and higher value indicates hyperfibrosis. Hydroxyproline level, an index for lung injury, in BLM administered group was reduced in a group of BLM+EM703.

Next, the suppressive effect of the compound EM703 against pneumonia caused by influenza viral infection was examined.

Sample was dissolved in physiological saline containing 1% DMSO and amount corresponding to oral dosage of the small administration for long-term therapy was administered from day-1 to day-6 of the infection to mice influenza pneumonia model (0.3 mg and 0.03mg/mice), once a day, intraperitoneally. Results were compared with control group which was given only solvent.

Sato K., Suga M., Akaike T. et al., Therapeutic effect of erythromycin on influenza virus-induced lung injury in mice. Am. J. Respir Crit. Care Med. 157, 853-859, 1998.

Results are shown in Fig.2 and Fig.3. In this system, mice developed pneumonia and almost died about 20 days after infection. Contrary to that, as shown in Fig. 2, administration of EM703, 0.3 mg/mice, cured pneumonia and 40% of mice were survived. Further, as shown in Fig. 3, mice without administration of drugs (control) indicated significant decrease of body weight due to pneumonia, but administration of EM703 indicated to increase body weight from day-10. This indicates suppressive effect against pneumonia and result to cure pneumonia.

As described above, the compound of the present invention shows suppressive effect against influenza virus-induced pneumonia.

##### Synthesis of EM701

Glacial acetic acid solution of erythromycin A (12.4 g, 16.9 mmol) was stirred at room temperature for 2 hours, added slowly aqueous sodium hydrogen carbonate and neutralized. The reaction mixture was extracted with chloroform, dehydrated the organic layer with sodium sulfate, filtered off the sodium sulfate and removed the solvent by distillation to obtain crude substance. The crude substance was purified with silica gel chromatography (chloroform : methanol : aqueous ammonia = 10 : 0.5 : 0.01 →

10 : 1 : 0.05) to obtain EM201 (7.7 g, 63%). Subsequently, potassium carbonate (1.4 g, 10.6 mmol) was added to the methanol solution (100ml) of EM 201 (7.6 g, 10.6 mmol) and refluxed for 2 hours. After distilled off the solvent, the residue was dissolved in aqueous sodium hydrogen carbonate and extracted with chloroform. The mixture was dehydrated with sodium sulfate, filtered and removed the sodium sulfate, then the obtained crude substance was purified by silica gel chromatography (chloroform : methanol : aqueous ammonia = 10 : 0.5 : 0.01  $\rightarrow$  10 : 1 : 0.05) to obtain EM701 (5.9g, 78%, white powder).

Sodium acetate (3.9 g, 48.5 mmol) and iodine (2.5 g, 9.7 mmol) were added in this order to methanol (52.0 mL)-water (13.0 mL) solution of EM701 (6.9 g, 9.7 mmol) at room temperature, and stirred at 50°C for 3 hours. During the stirring, 1N aqueous solution of sodium hydroxide was added to maintain at pH 8-9 continuously. After confirming the completion of the reaction by TLC, the reaction mixture was diluted with aqueous ammonia (7.5 mL)-water (200 mL), and extracted with dichloromethane. After dehydrating the organic layer with sodium sulfate, the

sodium sulfate was removed by filtration and distilled off the solvent to obtain crude substance. The crude substance was purified by silica gel column chromatography (chloroform : methanol : aqueous ammonia = 10 : 0.5 : 0.01 → 10 : 1 : 0.05) to obtain EM703 (4.8 g, Yield: 70%, white powder).
